

## **How to transfer waypoints from your GPS to MapCreate™ 6**

This is a quick reference guide to help you successfully transfer the waypoints from your GPS unit to MapCreate 6. Please print this out and refer to it when you want to transfer the waypoint data. This procedure assumes that you have the software installed on your computer already, and also that the MMC/SD reader is plugged in to your computer and that it is working correctly. \*NOTE: If you have Windows® 98, then you also need to load the drivers for the MMC/SD reader. The drivers are located on the West CD. Do not load these drivers if you are running an operating system other than Windows 98.

1) Insert your MMC/SD card in your GPS. Turn on the GPS. Press Menu twice. Highlight System Setup and press Enter. Highlight Transfer My Data and press Enter. A box will appear that will say "Transfer data which way? Save or Load;" select Save and press Enter. Now you should see a menu displaying the MMC card and the default file name Data.usr. (You can change the name if you want, then highlight Save Data and press Enter.) Now highlight Save Data and press Enter. A message will appear that says "User Data Saved Successfully." Now all of the waypoints should be loaded on the MMC/SD card.

2) Now take your MMC/SD card out of the GPS and insert it in your MMC/SD card reader at your computer. Open MapCreate 6. Click on File at the top of the MapCreate 6 screen, highlight Open GPS Data File and left click. An Open screen will appear. At the top of the Open screen where it says Look In, make sure it says **Removable Disk** to the right of that. If it does not say **Removable Disk**, be sure to change it so that it does. Now in the box below Removable Disk you should see your Data file, or whatever you named it. Double click on that data file. Now all of your waypoints should be on your MapCreate 6 screen.

If you need further assistance, call Customer Service in the U.S. at 800-324-1356; call Customer Service in Canada at 800-661-3983.
